Prototyping

Storyboarding

Tasks Flows and Storyboarding

Storyboards and TaskFlows are **methods** in UI/UX design, that help designers **visualize and structure user interactions**.

While they are **interrelated**, they each serve specific purposes at different stages of the design process.

Storyboard

- A sequence of sketches that captures a task-decription(or a TaskFlow).
- Each sketch shows a moment of time / a single scene.

“A storyboard is represented as a sequence of "freeze-frame" sketches or cells, each one capturing one step in the overall task “

Example: Campus Food Ordering Service

Task: Order food from campus canteen

Task Flow

Open app

- Select Food Service
- Browse stalls
- Select stall
- View menu
- Add items
- Checkout
- Payment confirmation

Storyboard Scenes:

- Student in lecture → feels hungry
- Opens super-app
- Browses nearby food stalls
- Selects a stall and food item
- Confirms order
- Receives pickup notification

1. In Lecture – Feels Hungry

2. Opens Super-App

3. Browses Nearby Food Stalls

4. Selects Stall & Food Item

5. Confirms Order

6. Pickup Notification

Other Storyboard Formats

e.g. Photo-Based Storyboards and Video Stories

Skinput: Appropriating the Body as an Input Surface (CHI 2010)

<https://youtu.be/g3XPUdW9Ryg>

Two parts of the Storyboard

Story part

A narrative that provides a purpose, context, some background, brings persona in

Task part

specific instructions or stepwise details about what is expected from the user interactions.

Concrete, Actionable, later used in the prototype evaluation with the user.

TaskFlows vs Storyboards

Task Flows

“what user does”
specific, actionable steps
users take.

Descriptive/ Diagrammatic
representation .

For analyzing and
validating user interaction
steps.

Storyboard

Visual representation of
task -flows; often includes
user's context and
emotions.

Concrete/visual/narrative.

For communicating design
ideas and user experience
to others (stakeholders,
teammates).

Storyboards often emerge from task flows.
First map what happens, then illustrate how it happens in the real world.

How to Use TaskFlows and Storyborads in Your CS3240 Project

- You are required to **identify and analyze three key tasks** for each service.
- How you document tasks is up to you, but we recommend
 - Use task analysis to break down steps and **provide TaskFlows. Task steps should be clear, ordered, and easy to follow.**
 - In addition, you may use storyboards
 - to visually showcase interactions
 - if you find that the task narrative is better communicated through visual means.
 - Keep task documentation simple yet effective. Avoid unnecessary complexity.

Prototyping

Prototyping Goal:

To let users try out the prototypes for the tasks you've developed

Why Do We Prototype?

We prototype to:

- Test design ideas BEFORE building real systems
- Identify usability problems early
- Compare multiple design options
- Get feedback on user tasks

IMPORTANT:

You are NOT building/prototyping all the features of each of the services or full super-app.

You will prototype and test at least 3 key user tasks for each service.

User Tasks (from analysis)

Task Flows

Screens and Interactions

Prototype

Prototype Fidelity

The degree of realism in the prototype

Stage	Purpose	What it looks like
Storyboard	Understand Task Flow & Context	Sequence of framed sketches / scenes
Lo-fi (Lo-fidelity)	Test Task flow	Mock-ups using e.g. paper/wood/foam materials
Wireframe (mid-Fidelity)	Define layout	Screen Layouts
Hi-fi (Hi-fidelity)	Test interactions	Clickable prototype

You DO NOT jump directly to hi-fi

Lo-Fidelity Prototyping

Simple sketches, screen designs, user flows
Decide on design elements – typography, colors, sizes

Develop layouts, organise information, decide e.g. visual hierarchy, screen size, graphics, spacing
Add some content and partial interactivity

Hi-fidelity Prototyping

Add realistic content and full interactivity
Design closer to the final application

Prototype Fidelity

The degree of realism in the prototype

Interactivity

(clicks and links work fully ..partially..or not at all)

Visuals

(e.g. visual hierarchy, screen size, graphics, spacing, and layouts)

Content and navigation
(full or partial)

Low Fidelity (Lo-fi) Prototype

- Faster and cheaper iterations of ideas
 - not limited by existing technology
 - typically using art craft materials
 - for easy evaluation of design ideas – Like, Dislike, Accept

Sketch screens:

e.g.

Home screen

Food service screen

Stall list

Menu screen

Cart

Payment

Use rough boxes:

-minimal colors

-minimal text

-focus on flow

Hand-sketched “screens” that represent a digital product.

Example - Lo-fi Prototype

PalmPilot wooden model, Jeff Hawkins, 1995
Jeff Hawkins tested the PalmPilot's design with this model, using a chopstick for a stylus. He took pretend notes in meetings, and counted the steps it took to perform common tasks.
Gift of Jeff Hawkins, 102619074

<http://bit.ly/1mcZF7X>

**Jeff
Hawkins,**

Example – Lo-fi Prototype

- Mozilla's Support website

Source- Article: Mozilla prototype case study
<https://www.nngroup.com/articles/mozilla-paper-prototype/?lm=prototypes-vs-wireframes-ux-projects&pt=youtubevideo>

(mid-fidelity) Wireframe

A wireframe is a rough schematic created in the early stages of digital product design to help visualize and communicate the structure of a product or website.

continued

A Wireframe is a visual skeletal representation of an intended design

- Layout - arrangement of content, interface elements eg navigation and buttons
- Generally, limited fonts, minimum content, white/black/grey color, minimum graphics

<https://youtu.be/qpH7-KFWZRI?si=Tk7pY9kwzaco-UDG>

<https://youtu.be/E5Z1QOly72E?si=kcV0of1b-jVhwnc2>

<https://careerfoundry.com/en/blog/ux-design/website-app-wireframe-examples/>

Why Wireframes?

They are faster to create because they are less detailed.

The product appearance and/or functionality aren't fully defined, so many of the details are unknown.

To get reviewers or collaborator to focus on the structure, layout, and navigation instead of visual details.

Hi-fidelity prototype

A detailed representation of a product, usually created later in the design phase, that works, looks, behaves, or moves as closely as possible to the intended final product.

- Hi-fi prototypes are as close as possible to the real interface
- Interactivity, content, visual, navigation, layout...
- Testable by users, for the task the prototype is designed for

Hi-fidelity prototype

Another example

Summarising - From Task to Prototype

Storyboard → Concept, user task flow

Lo-fi → Test Task Flow

Wireframe → Layout

Hi-fi → Interactions, like real

Prototype functionality

- **Horizontal** prototypes
 - surface level for the entire user interface/set of tasks with not much underlying functionality
- **Vertical** prototypes
 - includes in-depth functionality for a few selected tasks
 - with task-centred design users can test a few tasks in depth

In CS3240 super-app service:

DO:

- Prototype 2–3 key tasks end-to-end

DON'T:

- Prototype the entire app superficially

Focus:

Vertical prototyping for selected tasks

“The more of the prototype that is completed, the more you can test.”

Serial vs Parallel prototyping

ing

Usability Engine

Parallel Prototyping Leads to Better Design Results,
More Divergence, and Increased Self-Efficacy by STEVEN P. DOW, ALANA GLASSCO, JONATHAN KASS, MELISSA SCHWARZ,
DANIEL L. SCHWARTZ, and SCOTT R. KLEMMER; Stanford University

Serial vs. Parallel Prototyping

Concept	Definition	Pros & Cons
Serial Prototyping	Develop one prototype at a time , refining it step by step.	✅ Deep focus on a single idea per iteration. ❌ Risk of tunnel vision and missing alternatives.
Parallel Prototyping	Develop multiple variations of a design simultaneously , then compare and combine the best elements.	✅ Encourages diversity of ideas. ✅ Leads to better design decisions . ❌ Requires more effort in coordination.

We recommend **parallel prototyping** in your CS3240 project to explore multiple design ideas and merge the best elements into a final prototype.

This approach is commonly used in industry to avoid premature commitment to a single design.

A commonly used prototyping method - Wizard of OZ

Prototypes with faked functions.

Interactivity would be simulated, while users believe its real

<https://www.nngroup.com/articles/wizard-of-oz>

John F. (“Jeff”) Kelley coined the phrases “Wizard of OZ” and “OZ Paradigm” to describe the method he developed during his dissertation work at the Johns Hopkins University.

continued - Wizard of OZ

- User uses the system as expected
- A human Wizard, generally hidden, simulates the system's intelligence and interacts with user through a real-like interface
- Wizard interprets user's input according to an algorithm & gets interactive screen display/play accordingly
- A useful technique for testing futuristic ideas

Wizad of Oz – movie clip
<https://youtu.be/NZR64EF3OpA>

The Wizard of Oz method takes its name from the children's novel "The Wonderful Wizard of Oz" by Frank Baum. In this novel, the main protagonist, Dorothy, and her companions meet a giant head that appears to be a powerful wizard, only to learn that it's just an ordinary man pulling levers behind a curtain.

When to use Wizard of OZ ?

When Developing and Testing viability of interfaces that use new complex technologies where testing with static content is difficult, and full deployment of technology is expensive

- eg robotic, AI, and AR applications.
- Interfaces that take real-time information and present the results
- Conversational UIs

<https://youtu.be/XIHOzdYQ-GY?si=iEQwu0jcVDOQh>

Open, Close and Hybrid WoZ

Closed WOZ

Wizard chooses from pre-existing responses

Open WOZ

Wizard comes up with the responses on the fly

******Wizard should have product knowledge to compose responses on the fly

Hybrid WOZ

Wizard chooses from an existing set of responses OR creates a new response as needed

Applying Prototyping Concepts in Your CS3240 Project and Design Assignment

Your project requires lo-fidelity and hi-fidelity prototyping.

In project, you would prototype at least 3 key user tasks for each service
(You are NOT required to design entire service)

Task 1 → Prototype flow

Task 2 → Prototype flow

Task 3 → Prototype flow

You will later test your service for the three key tasks.

Overall, you would

- Apply Horizontal /Vertical Prototyping.
- Improve iteration and collaboration skills.
- Experience real-world product development workflows.

Wireframing and prototyping/vibe coding with AI

Context - How effectively can AI tools translate a design idea into visual concepts and working prototypes?

Approach - Using the same core prompt across a few prototypings, adjusting the focus and format as the tool requires it.

Base Prompt -

Design a digital system that helps conference organizers track and reduce food waste during large events.

The system should help organizers monitor food usage, track vendor contributions, identify surplus food, and coordinate redistribution or donations.

Users include event organizers, catering vendors, and sustainability managers.

Figma Ai (Figma Maker)

Design a **mobile and web dashboard** for a conference food waste management system.

Prompt: Design a digital system that helps conference organizers track and reduce food waste during large events. The system should help organizers monitor food usage, track vendor contributions, identify surplus food, and coordinate redistribution or donations. Users include event organizers, catering vendors, and sustainability managers.

Create the following screens:

1. Organizer dashboard showing food waste analytics
2. Vendor reporting screen where caterers log surplus food
3. Real-time alerts for excess food
4. Donation coordination interface connecting surplus food to NGOs
5. Event sustainability summary report

Focus on:

- clear information hierarchy
- simple user flow
- data visualization
- clean modern interface

Output should include multiple screens that represent a logical UX flow.

Output:

- **Good starting point:** Quickly generates a basic dashboard structure and layout.
- **Covers obvious features:** Identifies expected sections like analytics, reports, and data inputs.
- **Low novelty:** Designs are predictable and not very creative or exploratory.
- **Consistent visual style:** UI style remains coherent across screens even when features differ.
- **Fast iteration:** Can build on edits quickly if prompts clearly describe the change.
- **Needs precise prompts:** Vague edit requests result in generic or repetitive outputs.
- **No system explanation:** The AI does not outline the logic or structure it created; designers must interpret the screens visually.
- **Prototype instability:** Interactive prototype links often break or behave inconsistently.
- **Fragmented flows:** Each requirement tends to generate a separate page, leading to weak integration between screens.
- **Requires human refinement:** Works best as a rough starting framework rather than a complete solution. Can also be shown to user for user testing to get views.
- Paid version for manual editing.

Loveable AI

Create **an interactive prototype** for a conference food waste management platform.

Prompt: Design a digital system that helps conference organizers track and reduce food waste during large events. The system should help organizers monitor food usage, track vendor contributions, identify surplus food, and coordinate redistribution or donations. Users include event organizers, catering vendors, and sustainability managers.

The prototype should include the following user flow:

1. Organizer logs into dashboard
2. Dashboard shows food waste metrics for the event
3. Vendors can log leftover food quantities
4. System generates alerts when surplus food exceeds a threshold
5. Organizer can assign food to donation partners

Focus on:

- simple dashboard layout
- clear navigation between screens
- basic interaction between pages
- mobile friendly interface

2. Using Loveable AI

Time taken: ~10 minutes to generate the prototype

- **More interactive setup:** Confirms features and requirements before building the prototype.
- **Clear system overview:** Provides a structured explanation of what the generated system includes.
- **Overall :** Effective for quickly generating a functional prototype structure, but still requires refinement for deeper UX thinking and richer data representation. Ignored that it was supposed to be a mobile version.

Output

- **Basic interpretation of prompt:** Builds what is asked but tends to stay literal and simple.
- **Misses some requested details:** Certain elements (e.g., sustainability metrics) may be overlooked.
- **Adds realistic product structure:** Introduces elements like login flows, landing pages, and event summaries (e.g., active events, completed events).
More product-like output: Feels closer to a real application compared to wireframe / layouts
- **Limited creativity:** Outputs remain conventional without novel interaction ideas or unexpected features.
- **No real data visualization:** Displays section headings and placeholders but lacks actual data examples or meaningful charts.
- **Handles edits well:** Responds reliably to iterative prompts when they are specific.
- **Component editing restricted:** Modifying generated UI components directly requires the paid version.
- **Stable prototype:** Navigation and interactions work consistently without breaking.

v0.dev - VibeCoding for Generating UI

Step 1 – Initial build

Build a simple web application that helps conference organizers track food waste during events.

Features:

- dashboard showing total food prepared, consumed, and wasted
- vendor submission form to report leftover food
- alerts when surplus food is available
- donation matching system to connect surplus food to NGOs

The interface should be clean and simple with a dashboard layout.

Step 2 – **Feature Expansion**

Add a vendor leaderboard showing which vendors have the lowest food waste during the event.

Step 3 – **UX improvement**

Improve the user experience by adding clear navigation, icons, and color coding for waste levels.

Step 4 – **Data Visualization**

Add charts to visualize food waste trends during the event and compare vendors.

Step 5 – **Mobile Optimization**

Optimize the interface for mobile devices used by vendors during events. Also add some motion design and animations.

Outcomes

- **Weak visual quality:** Overall UI aesthetics are poor and below basic design standards.
- **Poor data visualization:** Charts and graphs are badly designed and not very usable.
- **Bug-prone builds:** Since the tool generates code, the dashboard sometimes fails to load or run correctly.
- **Slow generation time:** Building and debugging outputs can take significantly longer than other tools.
- **Improves with edits:** Iterative prompts can improve the output, but require very specific instructions.
- **Poor visual decisions:** Default color choices and styling often look unrefined.
- **Supports motion elements:** Can add basic micro-interactions or animations when explicitly requested.
- **Mobile limitations:** Struggles to generate proper mobile layouts even when specifically prompted.
- **Prompt-heavy workflow:** Requires many detailed prompts to achieve usable results, increasing time and effort.
- **Stable functional prototype:** Once generated, the prototype generally works reliably across screens.
- **No creative exploration:** Focuses on functional implementation rather than proposing new design ideas.

Comparison

Metric	Figma AI	Lovable	v0.dev
Time to generate	~5 mins	~10 mins	~15–20 mins
Type of output	UI screens + basic prototype	Working web app prototype	Coded UI interface
Visual design quality	Clean but always same	Decent but basic	Poor visuals
Data visualization	Basic dashboard charts	Mostly placeholders	Section clear, charts poor
UX flow quality	Fragmented, screens not well integrated	Logical product flow with login & landing	Not well structured
Creativity / novelty	Low – predictable layouts	Low – literal interpretation	Very low – purely functional
Realism of product	Feels like design mockups	Feels closest to a real product	Feels like a raw coded interface
Best use case	Rapid UI layout exploration	Quick functional prototype	AI-assisted frontend generation
